

## ☆ 雨水浸透施設計算書

### ◎ 対策雨水量

$$Q1 = C \cdot I \cdot A \quad \left| \begin{array}{l} Q1 : \text{対策雨水量 (m}^3/\text{hr)} \\ C : \text{流出係数} \quad I : \text{降雨強度 (m/hr)} \quad A : \text{対策面積 (m}^2\text{)} \end{array} \right.$$

- ・ 対策面積  $A = 200.00 \text{ m}^2$
- ・ 流出係数  $C = 0.9$
- ・ 降雨強度  $I = 75.0 \text{ mm/hr} = 0.075 \text{ m/hr}$

$$\text{対策雨水量 } Q1 = 0.9 \times 0.075 \times 200.00 = 13.500 \text{ m}^3/\text{hr}$$

### ◎ 雨水浸透施設

- ・ 土壌の飽和透水係数 細砂  $Ko = 0.015 \text{ cm/sec} = 0.54 \text{ m/hr}$
- ・ 各種影響係数  $C = 0.81$

※ 浸透枰  $D1000 \times H1500$  (個数  $N=2$ )

- ・ 比浸透量  $Kf = aH^2 + bH + c = 1.4200 \times 1.500^2 + 7.0800 \times 1.500 + 2.382 = 16.197 \text{ m}^2$   
 $a = 0.475D + 0.945 = 0.475 \times 1.000 + 0.945 = 1.4200$   
 $b = 6.07D + 1.01 = 6.070 \times 1.000 + 1.01 = 7.0800$   
 $c = 2.570D - 0.188 = 2.570 \times 1.000 - 0.188 = 2.3820$
- ・ 基準浸透量  $Qf = Ko \cdot Kf = 0.54 \times 16.197 = 8.746 \text{ m}^3/\text{hr}/\text{個}$
- ・ 設計浸透量  $Q = C \cdot Qf = 0.81 \times 8.746 = 7.085 \text{ m}^3/\text{hr}/\text{個}$
- ・ 浸透量  $Fc = Q \cdot N = 7.085 \times 2 = 14.169 \text{ m}^3/\text{hr}$

$$\text{総浸透量 } \Sigma Fc = 14.169 \text{ m}^3/\text{hr}$$

$$Q1 = 13.500 \text{ m}^3/\text{hr} < \Sigma Fc = 14.169 \text{ m}^3/\text{hr} \quad \therefore \text{O.K.}$$
