

Code and Decode

\$ Introduction

Documents attached to an e-mail should be coded, because of keeping secret.

This application software can code documents, and can decode documents that were coded by this application software.

\$ Coding

If there are several files to be coded, these files should be compressed so as to be “one” file by using a file compression tool.

Then, apply this application software.

1. Copy a file to be coded in a temporary directory.
2. Press <Code> button.
3. Then, assign a file to be coded by using the file selection dialog box.
4. Next, assign a key file (that is applied to code the assigned file) by using the key file selection dialog box.

[Note]

- * For the first time using this application software, select <Use a default key file assigned by application>.
- * After second time (when using this application software), you can choose either <Use a default key file assigned by application> or <Use a following key file assigned by user>.
- * When applying <Use a following key file assigned by user>, you should select a correct key file (that is applied to code the selected file).

5. If no error occurs, a success message appears.

\$ Decoding

1. Copy a coded file and a key file in a temporary directory.

[Note]

- * If a coded file was created by using a key file (that you already have in a temporary directory), it is not necessary copy it (again) in the directory.

2. Press <Decode> button.
3. Then, assign a file to be decoded by using the file selection dialog box.
4. Next, assign a key file (that is applied to decode the selected file) by using the key file selection dialog box.

[Note]

- * When applying <Use a default key file assigned by application>, names of the coded file and the key file should be same, except their file extensions.
- * When applying <Use a following key file assigned by user>, you should select a correct key file (that is applied to decode the selected file).

5. If no error occurs, a success message appears.

\$ Example of filenames

Original (or, decoded) filename:

abcdefg.pqr

Coded file:

abcdefg_pqr.____

Key file:

abcdefg_pqr.KEY

***** IMPORTANT *****

Do not modify filenames of the coded file and the key file.

\$ Others

If the size of a coded file is too large for sending it through e-mail, you can use “File Division and Merger” tool and send the divided files.
